24. 两两交换链表中的节点**

地址: ②两两交换链表中的节点

题目:

• English:

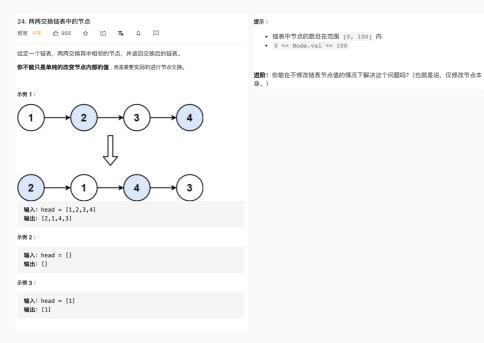

Constraints:

- The number of nodes in the list is in the range [0, 100].
- 0 <= Node.val <= 100

通过次数 278 793 提交次数 398 58

• 中文:

思路 1: 双指针之快慢指针

分析

```
★ Slow pointer:从列表头开始;

★ fast pointer:从列表头后一个节点开始。

★ 遍历过程:

★ 每次遍历将快慢指针的值互换;

★ 快慢指针每次都过两个节点。

★ 遍历结束条件:

★ fast.next == null:节点数为双数时,以防越界;

★ fast.next == null:节点数为单数时,以防越界。
```

代码:

```
// Java
 // Time : 2021 - 07 - 12
 public ListNode swapPairs(ListNode head) {
     // list empty or single node
     if (head == null || head.next == null) return head;
     ListNode slow = head;
                                  // slow pointer
     ListNode fast = head.next;  // fast pointer
     // loop through the list
     while (true) {
       // swap the value between slow and fast node
       int temp = fast.val;
       fast.val = slow.val;
       slow.val = temp;
       // loop through end
       if (fast.next == null || fast.next.next == null) break;
       \ensuremath{//} move slow and fast pointer to next next node
         slow = slow.next.next;
         fast = fast.next.next;
```

```
30 }
31 }
32 
33  // return result list
34  return head;
35 }
```

复杂度分析:

- 时间复杂度: O(n)
- 空间复杂度: O(1)
